I. Objective: This course will enhance the clinician’s comfort level managing patients wearing ocular prosthesis by focusing on care and management of prosthetic eyes and the anophthalmic socket including ocular tissue disorders.

II. History: A brief history of ocular prosthesis will be discussed.

III. Anophthalmic Procedures: A discussion on anophthalmic procedures will enable the clinician to be comfortable examining the socket of each entity.

   a. Enucleation: removal of entire globe
      i. Procedure
      ii. Indications
      iii. Complications
   b. Evisceration: removal of contents while preserving globe
      i. Procedure
      ii. Indications
      iii. Complications
   c. Exenteration: removal of all tissue within the socket
      i. Procedure
      ii. Indications
      iii. Complications

IV. Orbital Implants: Maintains orbital volume
   a. Importance of maintaining orbital volume
   b. Materials
   c. Complications
   d. Motility
   e. Pegging
V. The Ocular Prosthesis
   a. Fitting
   b. Patient expectations
   c. Cost
   d. Insertion/removal
   e. Care

VI. Ocular Tissue Disorders: A discussion of various ocular tissue disorders encountered in patients wearing ocular prosthesis and the management and treatment plan of each.
   a. dry eye
   b. allergy
   c. discharge
   d. discomfort
   e. pain
   f. ptosis
   g. lid laxity
   h. expulsion
   i. adhesions
   j. implant exposure
   k. peg problems

VII. Psychosocial Considerations
   a. Patient concerns

VIII. Conclusion/Take Home Points
   a. Importance of examining the anophthalmic socket
   b. Removal of prosthetic device
   c. Treatment of any underlying ocular tissue disorder
   d. Co-management with sub-specialties
