CONTACT LENS WEAR & CORONAVIRUS

Do’s & Don’ts

ACCORDING TO THE BEST AVAILABLE SCIENTIFIC EVIDENCE:

1. Contact lens wear remains a good option for healthy people.
   • There is currently no evidence to suggest that contact lens wearers are at more risk for acquiring COVID-19 than eyeglass wearers.
   • Contact lens wear continues to be a highly effective form of visual correction.

2. Proper hand washing is essential.
   • Wash hands for at least 20 seconds with soap and water and dry with a clean paper towel both prior to applying and removing your lenses.

3. Care for contact lenses properly.
   • If you wear daily disposable lenses, dispose of lenses after each wear.
   • If you wear reusable lenses, clean and disinfect your lenses according to eye care professional’s recommendations.
   • Pay particular attention to cleaning, drying and disposing of your lens case as directed. Monthly replacement of cases is suggested by experts.
   • As with any illness, anyone who does not feel well should stop contact lens wear until healthy again.

4. Eyeglasses should be cleaned regularly.
   • Viruses, such as COVID-19, can remain on hard surfaces for hours to days, which can be transferred to the spectacle wearer's fingers and face.
   • Wash your eyeglasses regularly.
   • Wash your hands prior to handling your eyeglasses.

5. Eyeglasses do not provide complete protection.
   • Standard eyeglasses do not provide protection from material entering from around the sides, top and bottoms of frames.
   • Neither standard eyeglasses nor contact lenses are approved for use as personal protective equipment (PPE) according to the CDC.
